

1. A division of narrow and wide modes would enhance use of narrow modes, including digital modes of the future.
2. Lessen FCC involvement and resources used for 160-meters because it would reduce disputes and conflicts between operators.
3. Provide protected space for experimentation with narrow modes of the future.
4. Protect all current narrow modes from wide-mode interference.
5. Bring 160-meters into the same basic structure as other bands below UHF, where ALL other bands have a narrow-mode-only segment.

Thanks!
